REASONS FOR ALLOWANCE

1. The response filed 8/30/2007 has been entered. Claims 1-12 are pending in this Office action.

Allowable Subject Matter

- 2. Claims 1-12 are allowed.
- 3. The following is a statement of reasons for the indication of allowable subject matter: none of the prior art of the record discloses or suggests that a signal observation system (SOS) for controlling a plurality of receiver channels simultaneously, the receiver channels comprised of tunable receivers and digitizers in a hardware configuration, wherein the tunable receivers and digitizers possess inherent properties that define their respective capabilities, the SOS comprising: a processor readable storage medium; code recorded in the processor readable storage medium to process a frequency schedule that defines an observation run, the frequency schedule being comprised of a set of lists, each list corresponding to a separate receiver channel, the lists comprised of a plurality of frequencies that define the frequencies each receiver channel is to observe during execution of the observation run and how long to observe each frequency before re-tuning to the next frequency in the list; code recorded in the processor readable storage medium to generate a local synchronization signal that defines a triggering hierarchy that each receiver channel will reference during the observation run; and code recorded in the processor readable storage medium to generate a start signal that is broadcast to the receiver channels that initiates an observation run that binds each receiver channel to the frequency schedule as recited in claim 1. None of the prior art

discloses storage means to receive and store digitized data observed by said receiver channels; triggering means to control the tuning of the receivers and the timing of the digitizers; and a processor coupled via a digital backplane with the digitizers, receivers, storage means, and triggering means to control the actions of the digitizers, receivers, storage means, and triggering means based on a user supplied frequency schedule, as recited in claim 6. And none of the prior art discloses processing a frequency schedule that defines an observation run, the frequency schedule being comprised of a set of lists, each list corresponding to a separate receiver channel, the lists comprised of a plurality of frequencies that define the frequencies each receiver channel is to observe during execution of the observation run and how long to observe each frequency before re-timing to the next frequency in the list; generating a local synchronization signal that defines a triggering hierarchy that each receiver channel will follow during the observation run; and generating a start signal that is broadcast to the receiver channels that initiates an observation run that binds each receiver channel to the frequency schedule, as recited in claim 8.
